

# TATA STEEL

## **Strip Products UK**

Our Strip Products UK business operates in both Port Talbot and Llanwern in South Wales. Port Talbot makes steel and, together with Llanwern, rolls it into strips. Llanwern then applies metallic coatings to the strips to protect the steel against corrosion. Hot-dip galvanised steels made at Llanwern have a zinc coating that offers excellent protection and can be used in a wide range of applications.

We produce hot rolled, cold rolled and hot dip coated steel and our products make an important difference to the world in which we live. Countless products are made with strip steel, but its most common uses are in automotive vehicles, construction components, domestic appliances and packaging. Our strip steels also go to other works in Tata Steel where they are coated with metallic elements, paint or plastic film, or formed into tubes.
