

TECHNICAL ADVICE DOCUMENT

Winter conditions - Plate - UK loads

1. This Technical Advice Document applies when:

- Air temperature is below 3°C and there is a risk of frost, ice or snow.

Note: Testing has shown that friction coefficients of steel products can be reduced by as much as 50% in freezing conditions. This means that extra restraints are needed to make loads safe when there is a risk of ice.

This Technical Advice Document covers the following product:

- Reversing mill plate

2. Essential requirements

- Trailers must be clear of debris, snow and ice.
- Do not load above the height of the trailer headboard.
- All restraint equipment must be inspected before use and be in good condition - see relevant Technical Information Sheets for *Belly-wrapping, Timber dunnage, Transport chains and tensioners, and Anti-slip matting.*
- All chains must be 8 mm minimum and be compliant with EN 12195-3 (Grade 8 chain).
- Webbing ratchets are not an acceptable tensioner type for use with chains.

3. Winter weather alert

Throughout the winter period a system will be in place to notify hauliers and Tata Steel despatch points of the risk of freezing conditions.

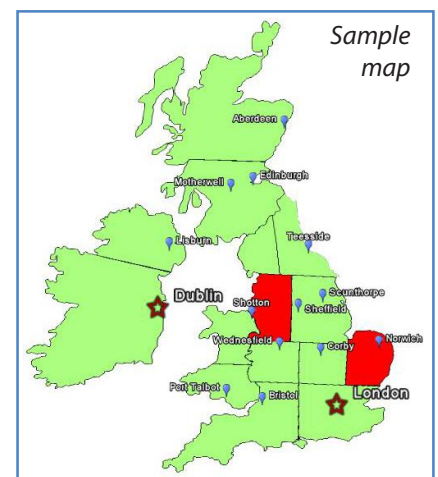

Regions of the UK will be deemed **Red Flag** restraint areas for a period of 24 hours if there is a risk of ice forming on the load. These regions will be coloured **red** on a map sent out daily to all despatch points and hauliers.

Loads despatched from or transiting the **Red Flag** regions will require the restraints identified in this document.

*Note: It is the driver's responsibility to apply the winter weather restraints when the load transits a region identified as **Red Flag**, or conditions deteriorate at the loading point or en-route and there is a risk of ice forming on the load.*

Risk of ice

4. Loading and restraint requirements

4.1 Fully blocked load

- ✓ Use dry timbers where possible.
- ✓ Minimum number of restraints according to Table 1 and 2.
- ✓ Restraints over product less than trailer width are to be belly-wrapped.
- ✓ **All product to be:**
 - Loaded to trailer headboard or stanchions
 - or
 - Blocked using wooden constructions
 - or
 - Have direct restraint in the form of cross-over chains.

Illustration below shows how all three methods can be utilised.

Illustration is for a full load restrained using 8 mm transport chain (LC 40 kN).

Table 1: 8 mm chain (LC 40 kN)

Load	Tie-down restraints
0 - 10 t	2
10 - 15 t	3
15 - 20 t	4
20 - 25 t	5
25 - 28 t	6

Table 2: 10 mm chains (LC 63 kN)

Load	Tie-down restraints
0 - 10 t	2
10 - 15 t	2
15 - 20 t	3
20 - 25 t	4
25 - 28 t	4

Belly-wrapping

See Technical Information Sheet on Belly-wrapping for more detail.

Longer chains may be required in order to apply a belly-wrap. Alternatively, two chains may be connected together provided the chains have suitable end attachments.

Cross-over restraints

Cross-over restraints must be anchored such that the hooks of the restraints are prevented from sliding forward, ideally anchored to lashing points.

4.2 Making use of anti-slip matting

- ✓ Use dry timbers where possible.
- ✓ Anti-slip matting to be placed both sides of timbers and between each plate.
- ✓ Apply a minimum of 4 restraints for a full load or 2 restraints per stack.

Loading with anti-slip matting

1. Place 500 mm long strips of anti-slip matting lengthways on the trailer, where the base timbers will be positioned.
2. Position base timbers across the anti-slip matting.
3. Place 500 mm long strips of anti-slip matting lengthways over the base timbers.
4. Load first plate.
5. Place anti-slip matting at regular intervals along the length of the plates, typically aligned with the timbers.
6. Load next plate and repeat.

100 x 100 mm pieces of anti-slip matting suffice between the plates.
